

Exchange Online PowerShell Glossary

Modernization reference resource

Keep this reference nearby while working through REST, object, performance, and migration concepts.
Online reference: <https://blog.sadhan.ch>

App-only

Authentication as an application or service principal rather than a delegated user.

CLIXML

PowerShell serialization format used by remoting and PSSerializer.

Connection record

Module-managed metadata describing an Exchange Online REST connection.

Exchange RBAC

Exchange role-based access control that authorizes cmdlets and parameters.

Get-EXO*

Optimized REST-era retrieval cmdlets with controlled property retrieval.

Managed identity

Microsoft Entra workload identity assigned to an Azure resource.

Minimum property set

Default schema returned by an optimized Get-EXO* cmdlet.

PSSession

PowerShell remoting session containing or referring to a remote runspace.

Property set

Named group of properties requestable by supported Get-EXO* commands.

RPS

Remote PowerShell; the legacy Exchange Online WinRM/WSMan model.

REST-backed cmdlet

Exchange cmdlet whose invocation is transported through the modern Exchange administrative REST path.

Serialization boundary

A point where an object is converted into a transport or storage representation.

Type stability

Predictability of PSTypeNames, CLR types, nulls, collections, and formatting across versions.

WAM

Web Account Manager, an authentication broker used by supported Windows scenarios.
