

Modernization Worksheet

Exchange Online PowerShell workload planning resource

Document one modernization effort from discovery through validation.

Capture the workload contract, migration assumptions, reliability controls, performance evidence, and final sign-off in one durable record.

Workload

Workload name

Owner

Repository / script

Change / incident reference

Business purpose

Current environment

PowerShell version

EXO module version

Operating system

Authentication method

Tenant(s)

Legacy assumptions

New-PSSession / Import-PSSession

Connect-EXOPSSession / -UseRPSSession

Get-PSSession / Remove-PSSession

Invoke-Command / remote script blocks

Serialization / Deserialized.* assumptions

Implicit property availability

Error-message parsing

Session-specific retry or recovery logic

Modernization Design

Define what the modern workload must preserve, change, and prove.

Connection design

Connection command / helper

Authentication model

Tenant validation

Connection-state validation

Routing strategy

Command import strategy

Data contract

Required cmdlets

Required properties / property sets

Filters and expected population

Application / report schema

Performance and Validation

Record the evidence used to decide whether the modernization is ready.

Performance experiment

Baseline workload

Comparison workload

Iterations

Page size

Warm-up

Alternating order

Elapsed time

Object count

Property count

Memory

Serialized size proxy

Errors / failures

Correctness

Observed result and interpretation

Validation gates

Functional

Data

Schema

Type

Error

Resilience

Performance

Security

Operations

Evidence and sign-off

Baseline artifact / location
